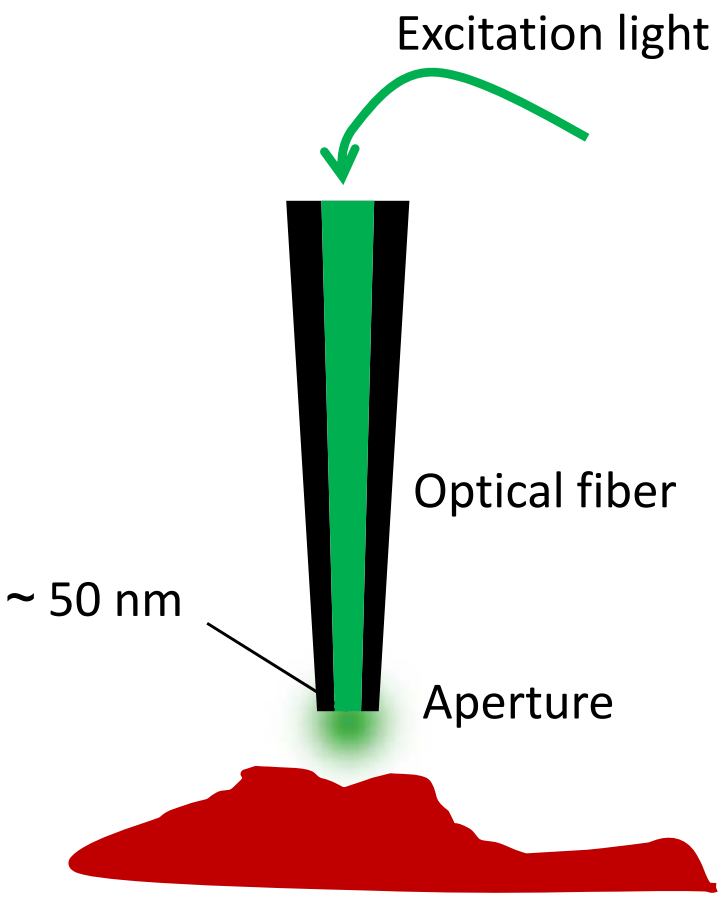
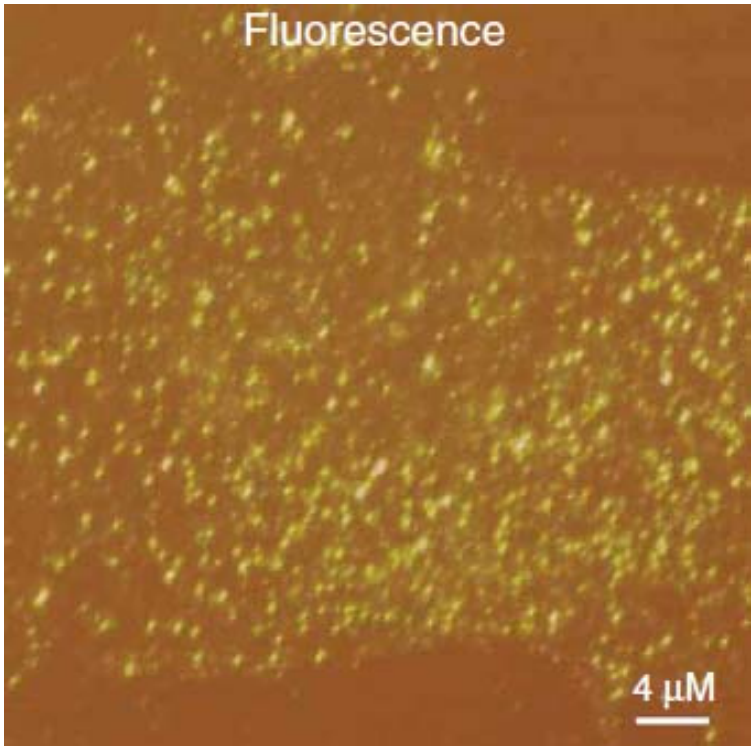
50 years to extend the resolution

- Confocal microscopy (1957)
- Near-field scanning optical microscopy (1972/1984)
- Multiphoton microscopy (1990)
- 4-Pi microscopy / I^5M (1991-1995)
- Structured illumination microscopy (2000)
- Negative refractive index (2006)

Near-field scanning optical microscopy



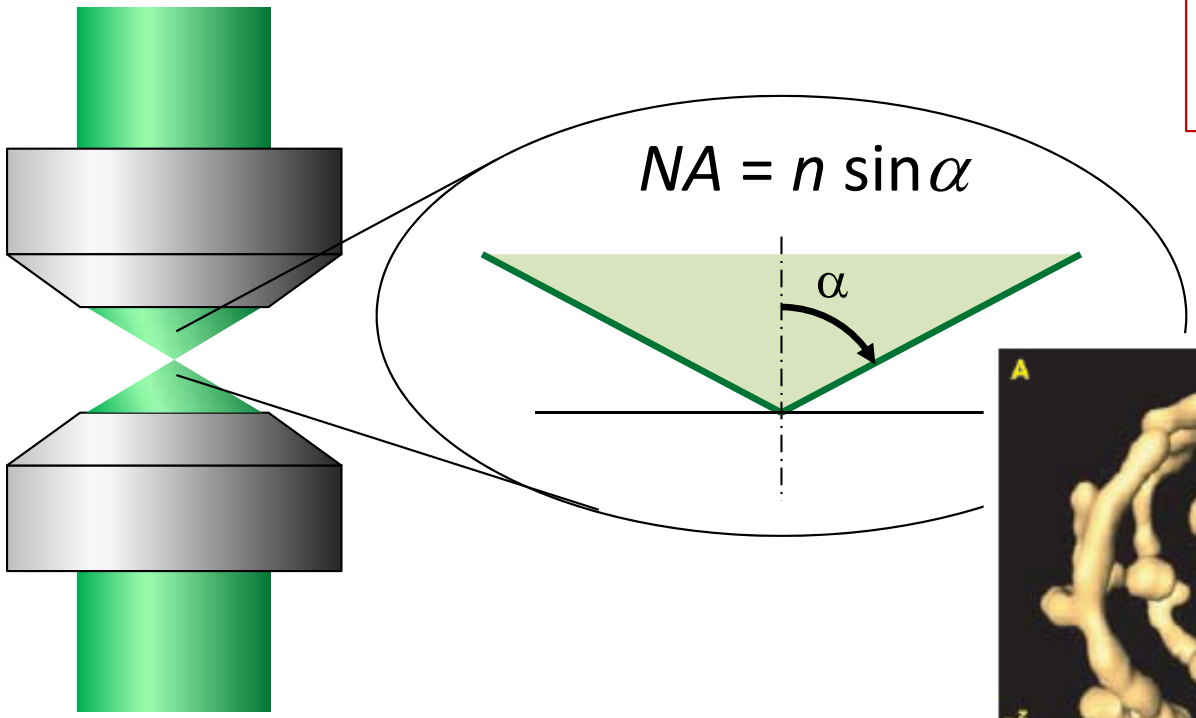
β_2 adrenergic receptor clusters on the plasma membrane

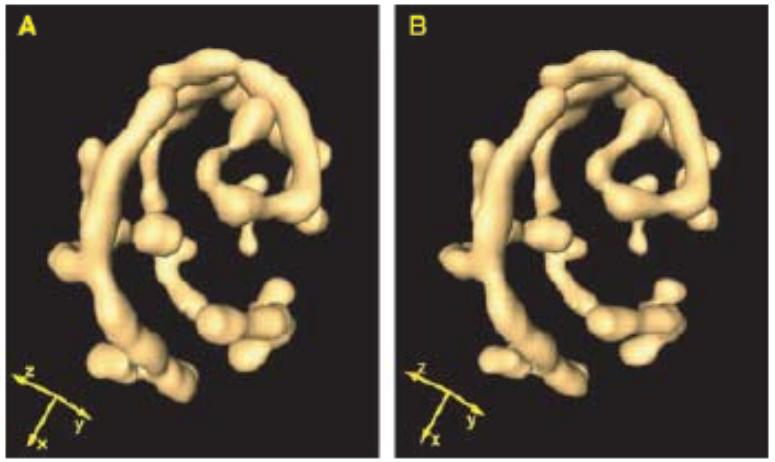


Ianoul et al., 2005

4-Pi / I^{5}M

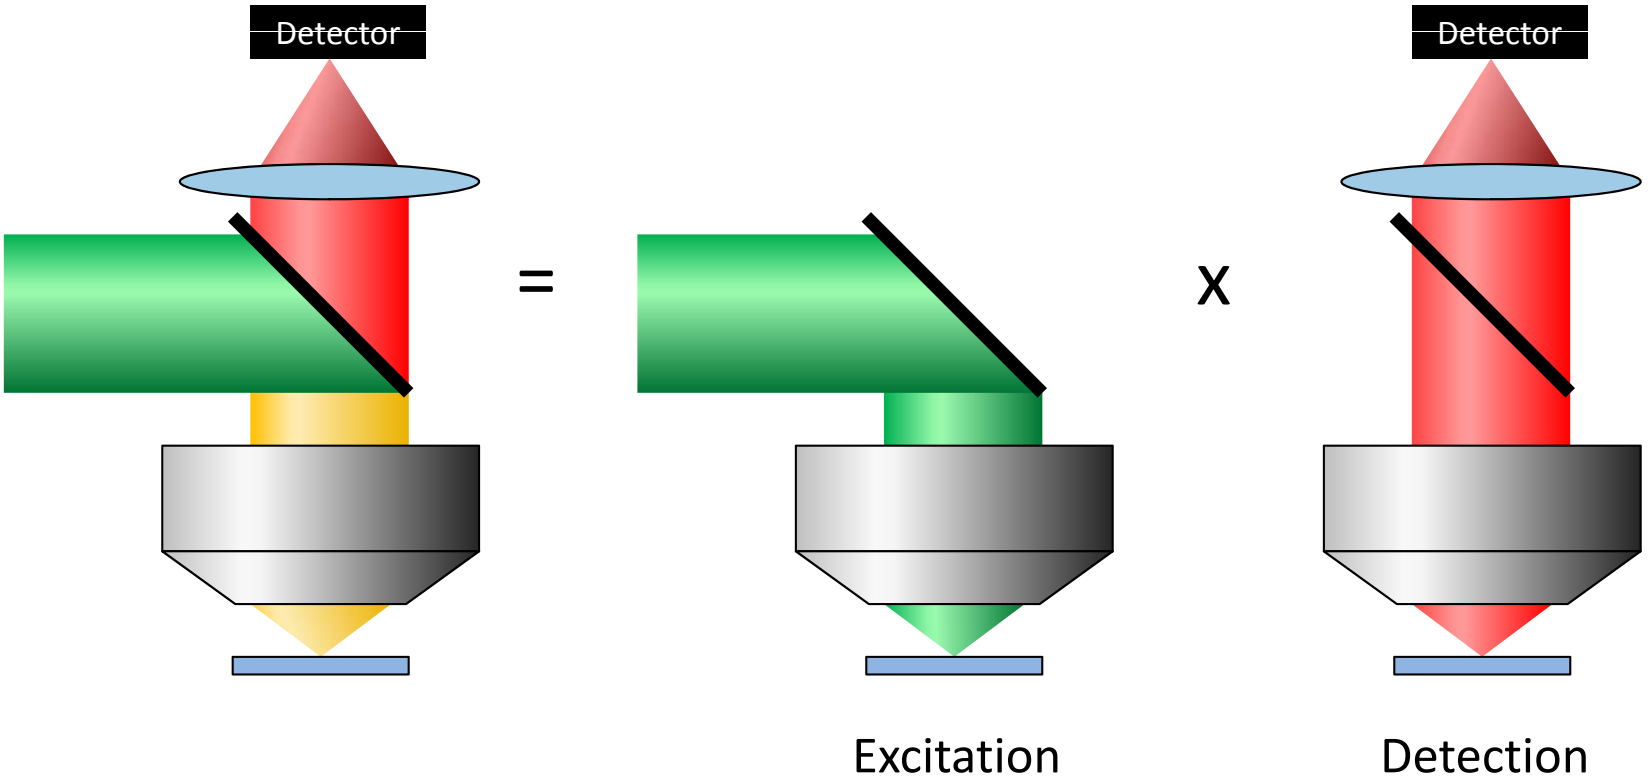
$$d \approx \frac{\lambda}{2\,NA}$$



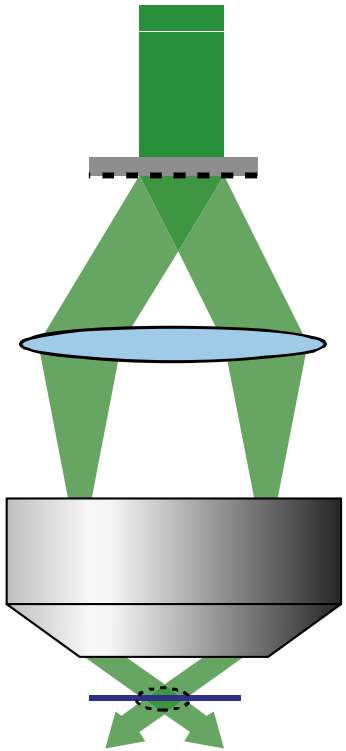


Major advantage:
Similar z resolution as x-y resolution

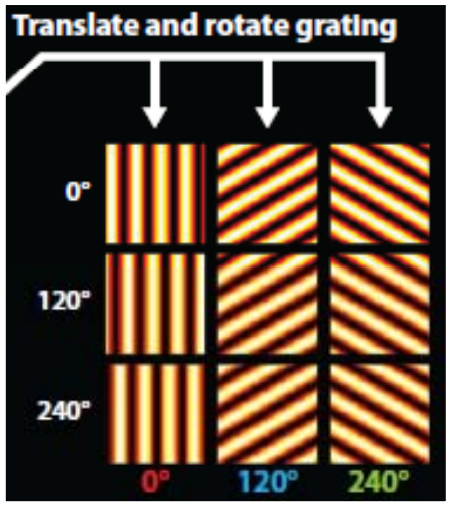
Patterned illumination



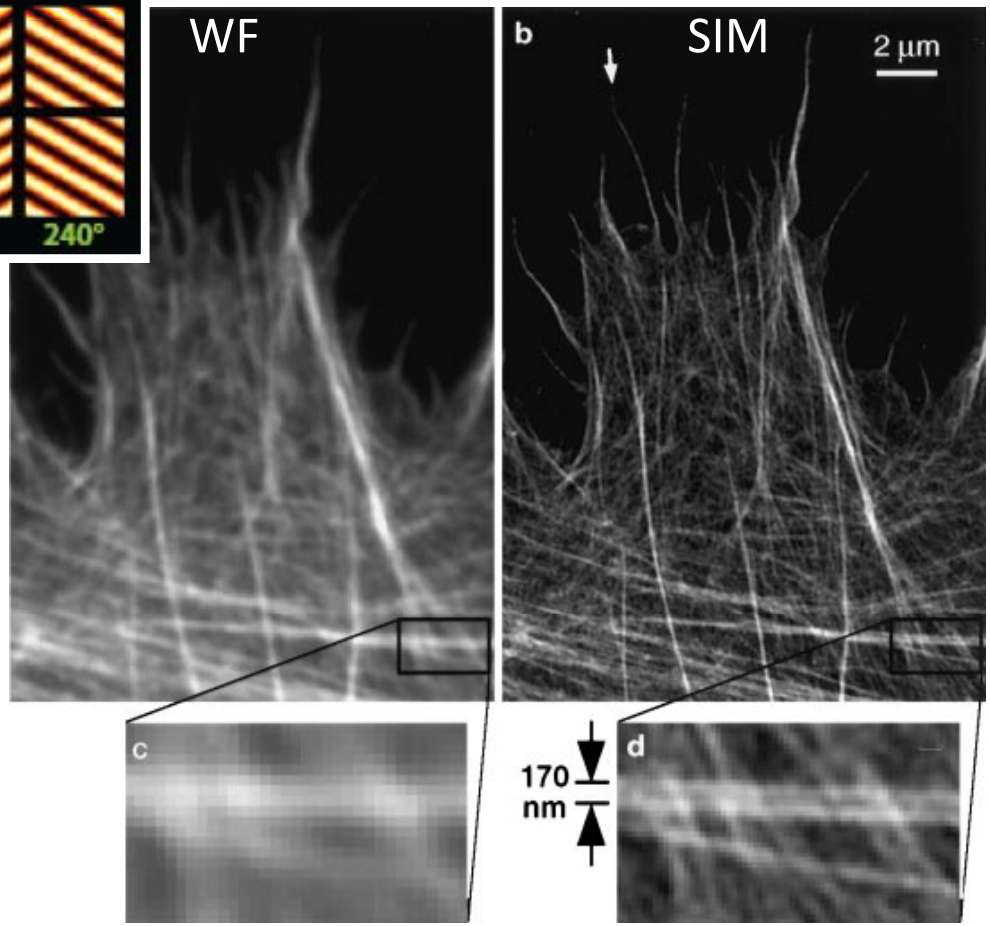
Structured Illumination Microscopy (SIM)

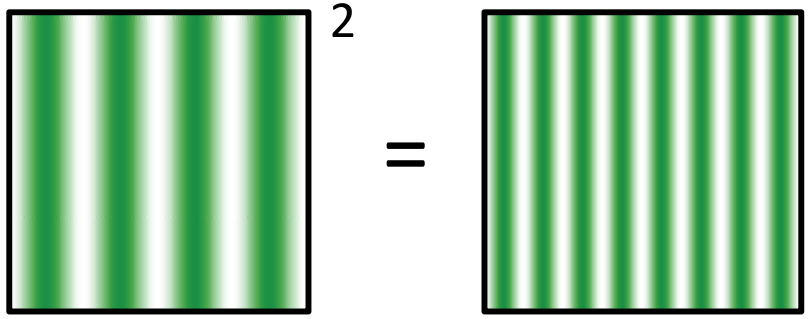


9 images



Reconstruction

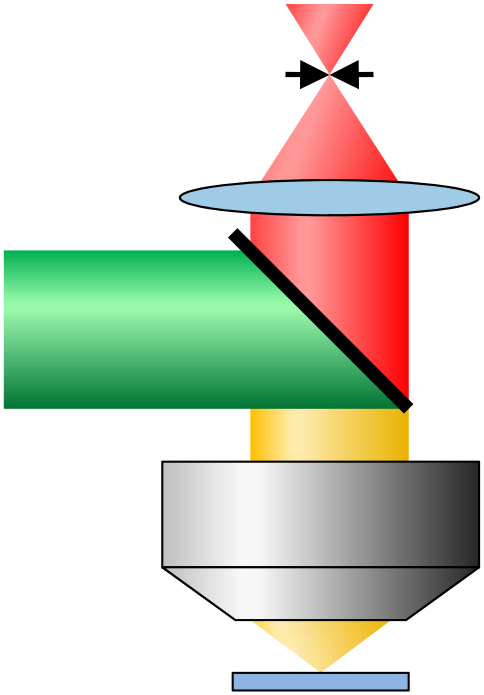




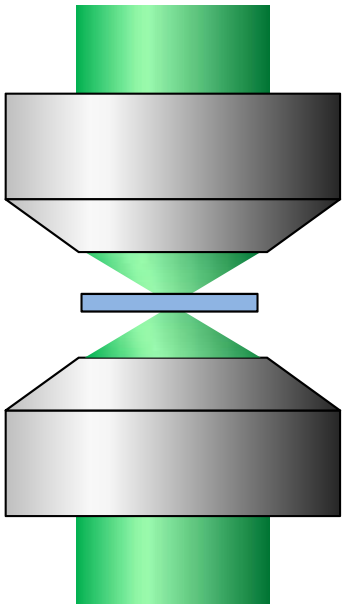
Gustafsson, J Microscopy 2000

The diffraction limit still exists

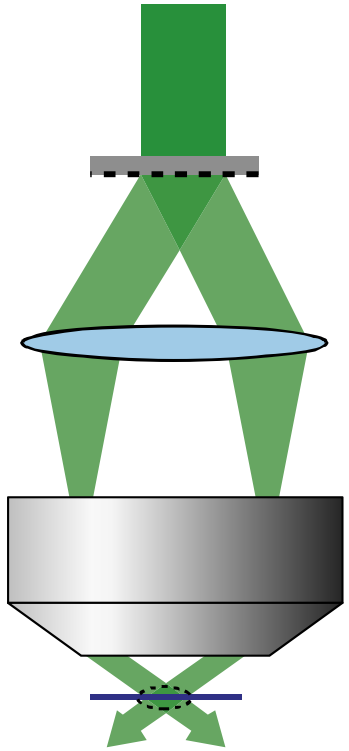
$$d \geq \frac{1}{2} \cdot \frac{\lambda}{2NA}$$



Confocal



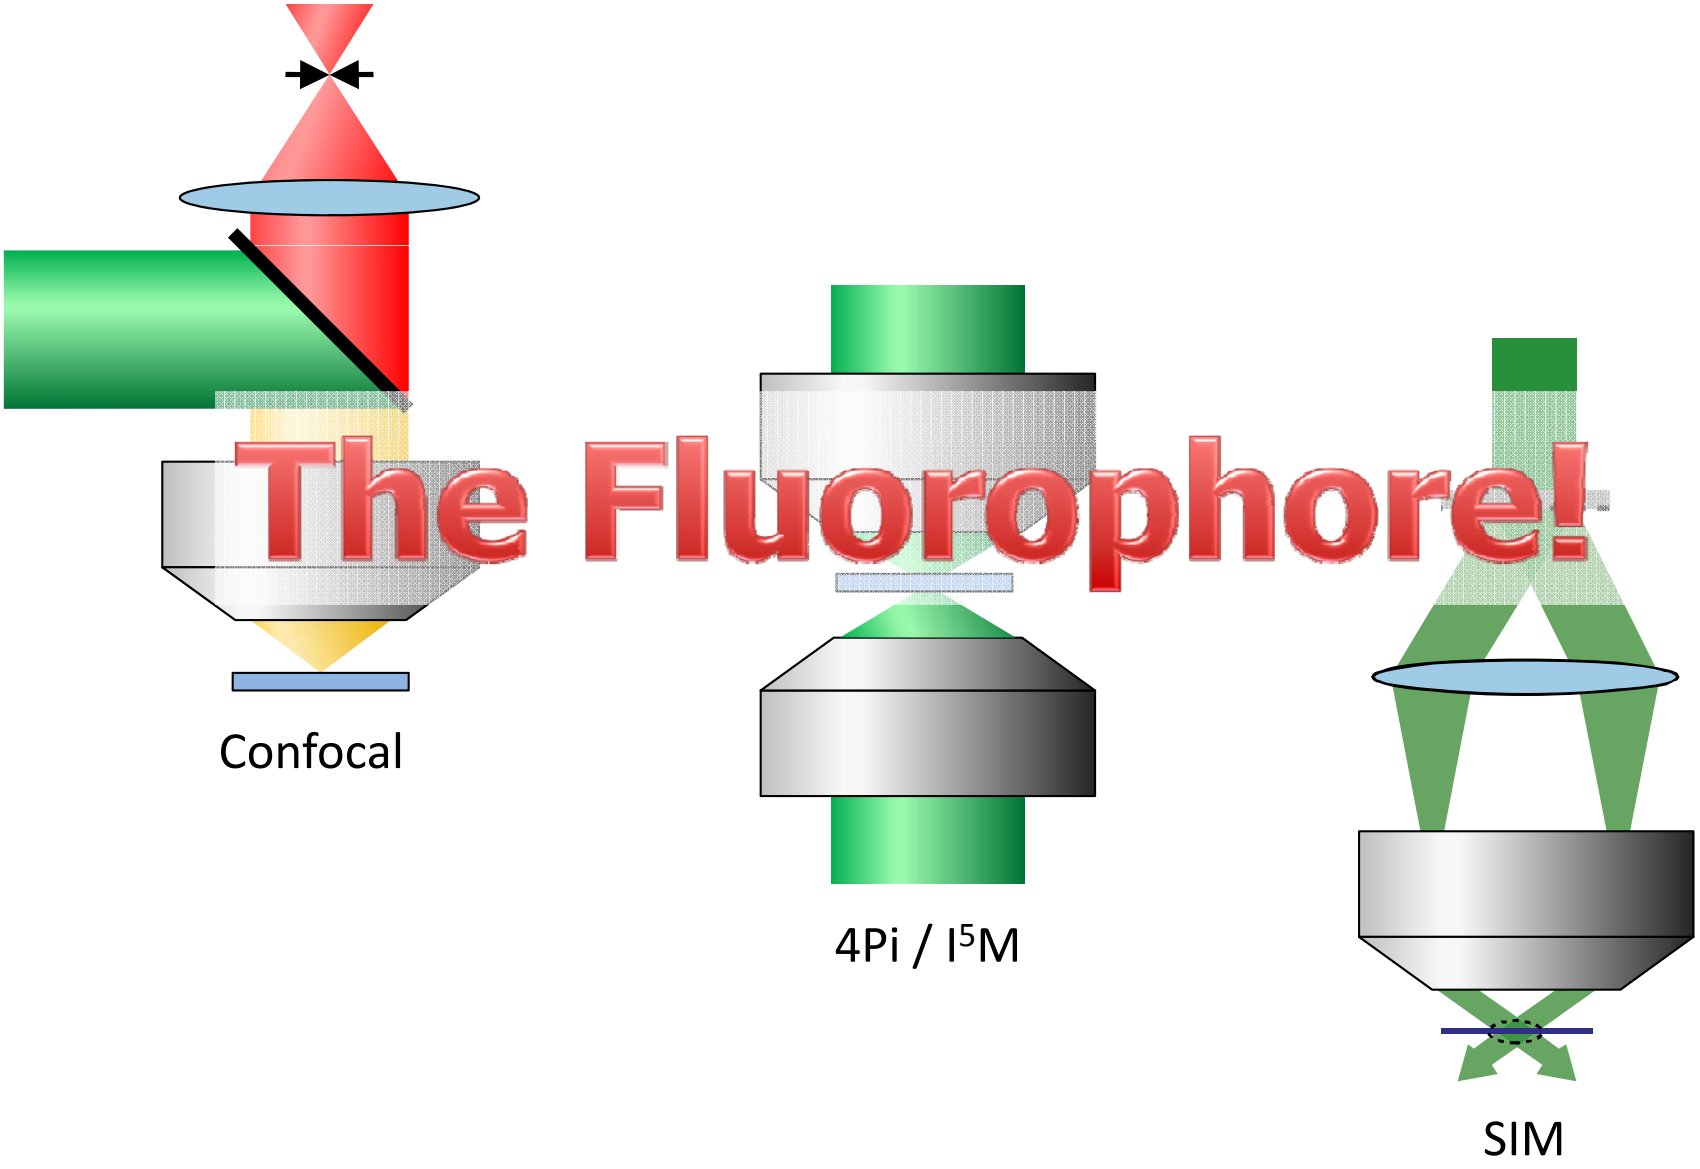
4Pi / I^{5}M



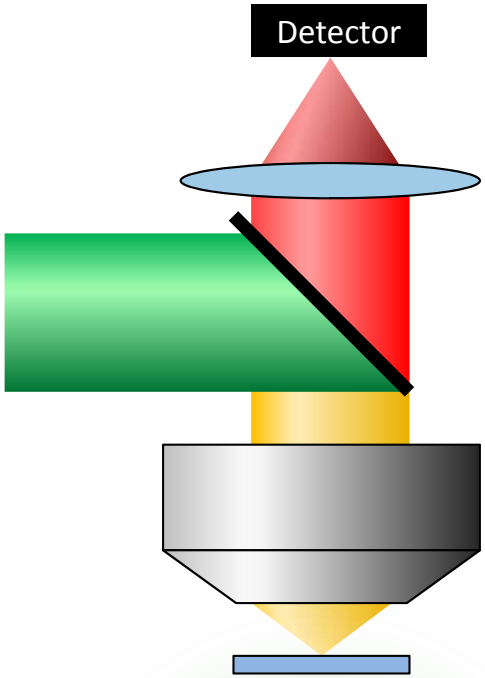
SIM

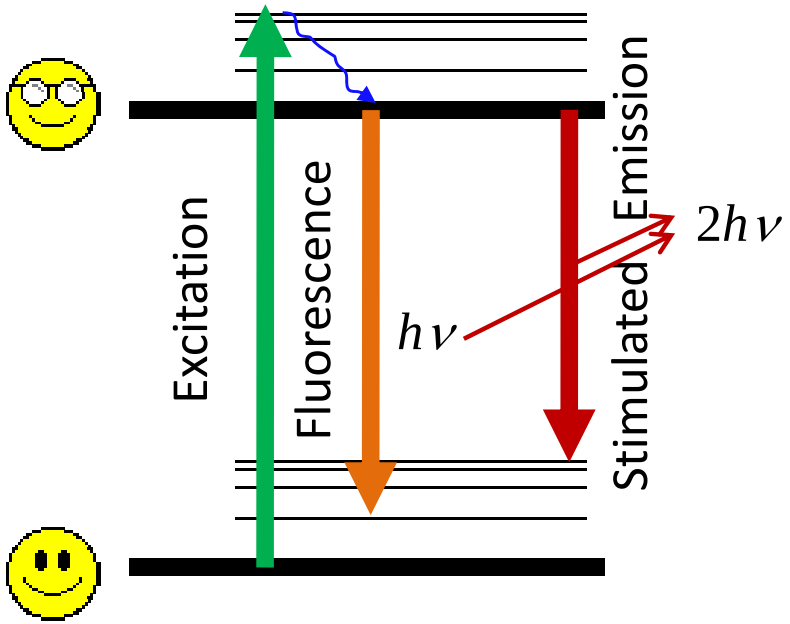
Breaking the diffraction barrier

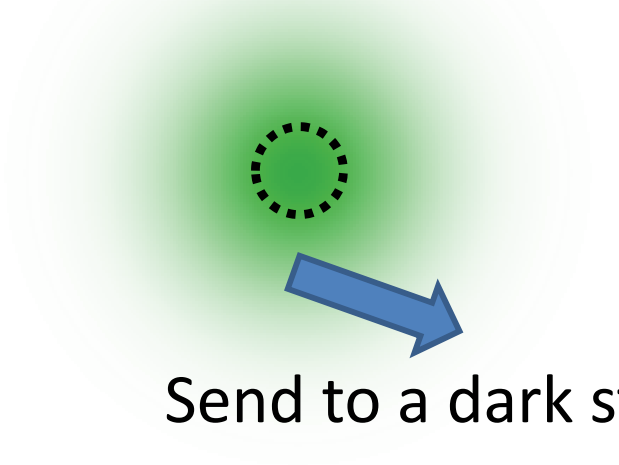
Breaking the diffraction barrier



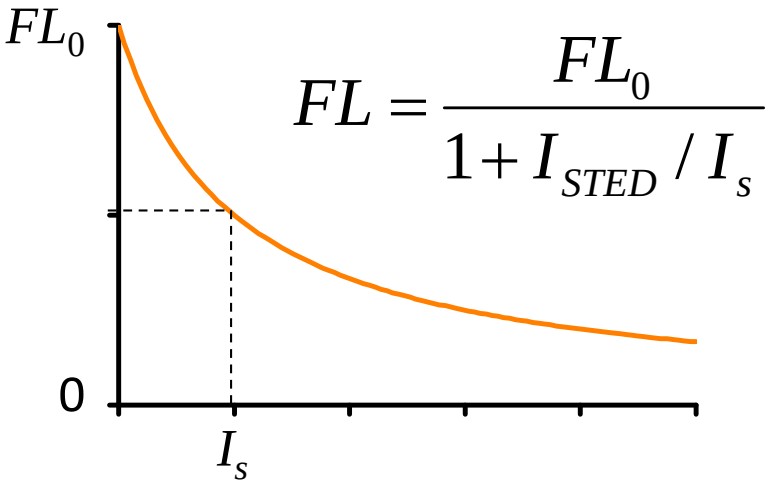
Stimulated Emission Depletion (STED)





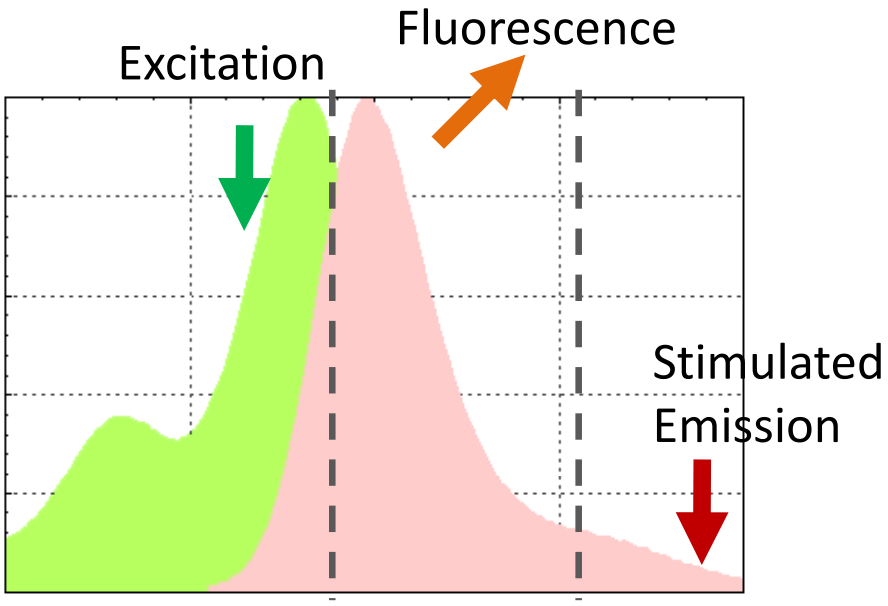


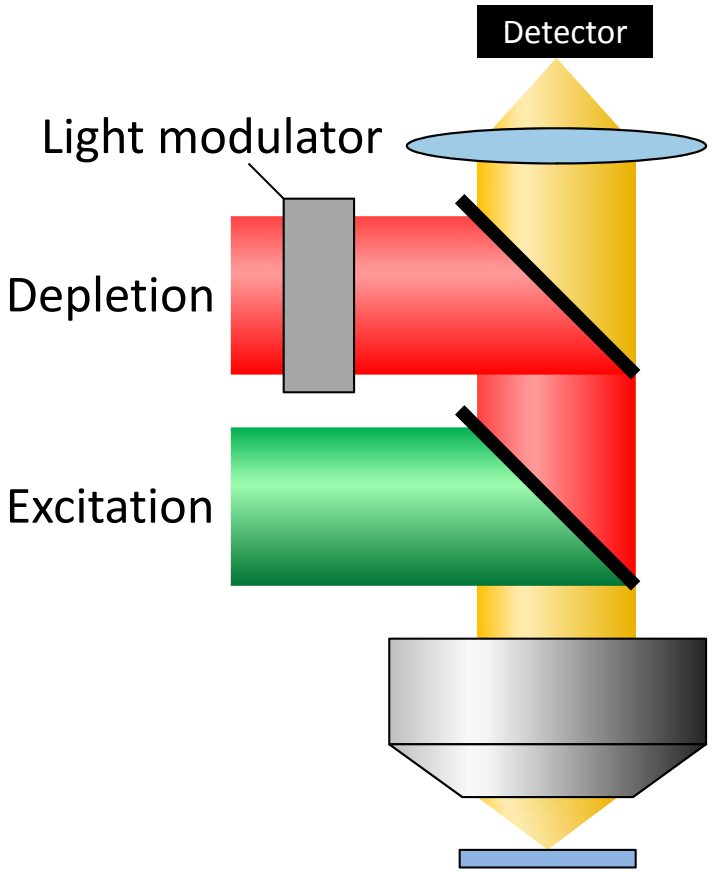
Send to a dark state

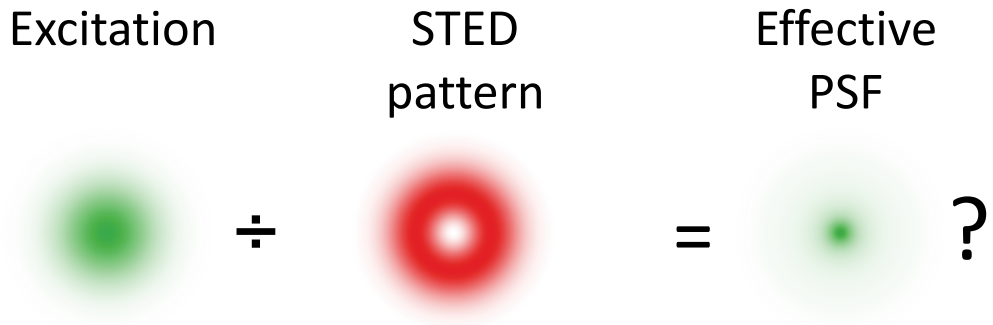


$$FL = \frac{FL_0}{1 + I_{STED} / I_s}$$

STED microscopy

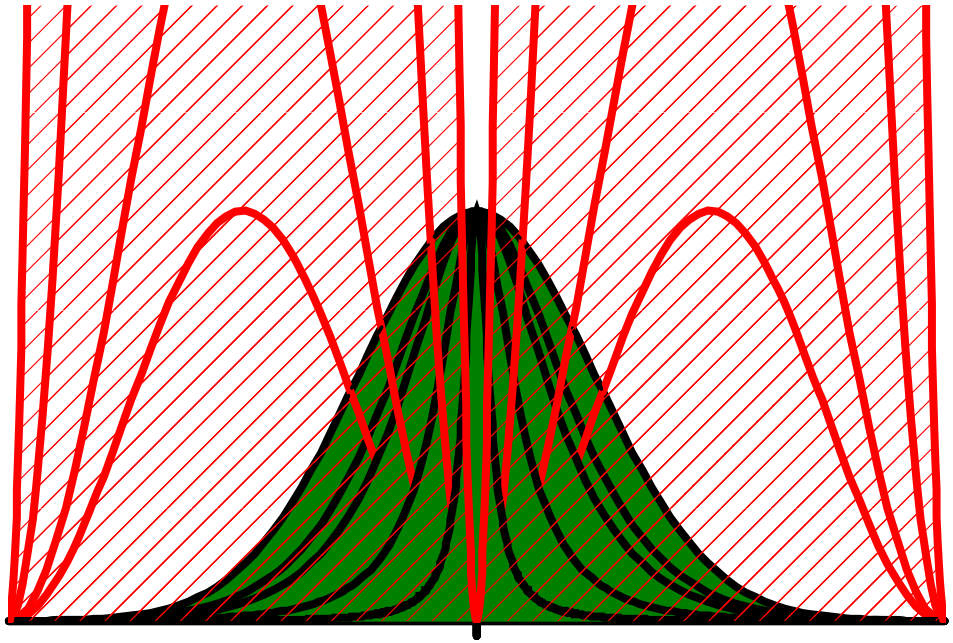






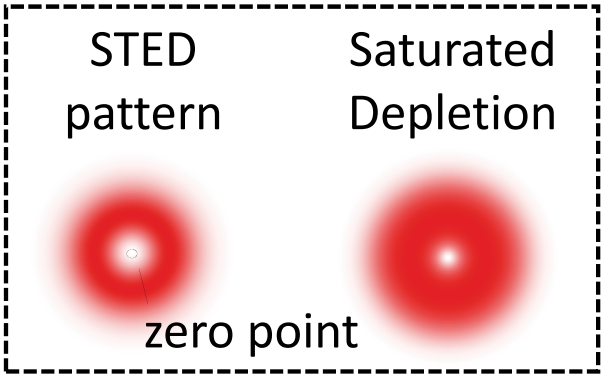
Hell 1994, Hell 2000

Saturated depletion

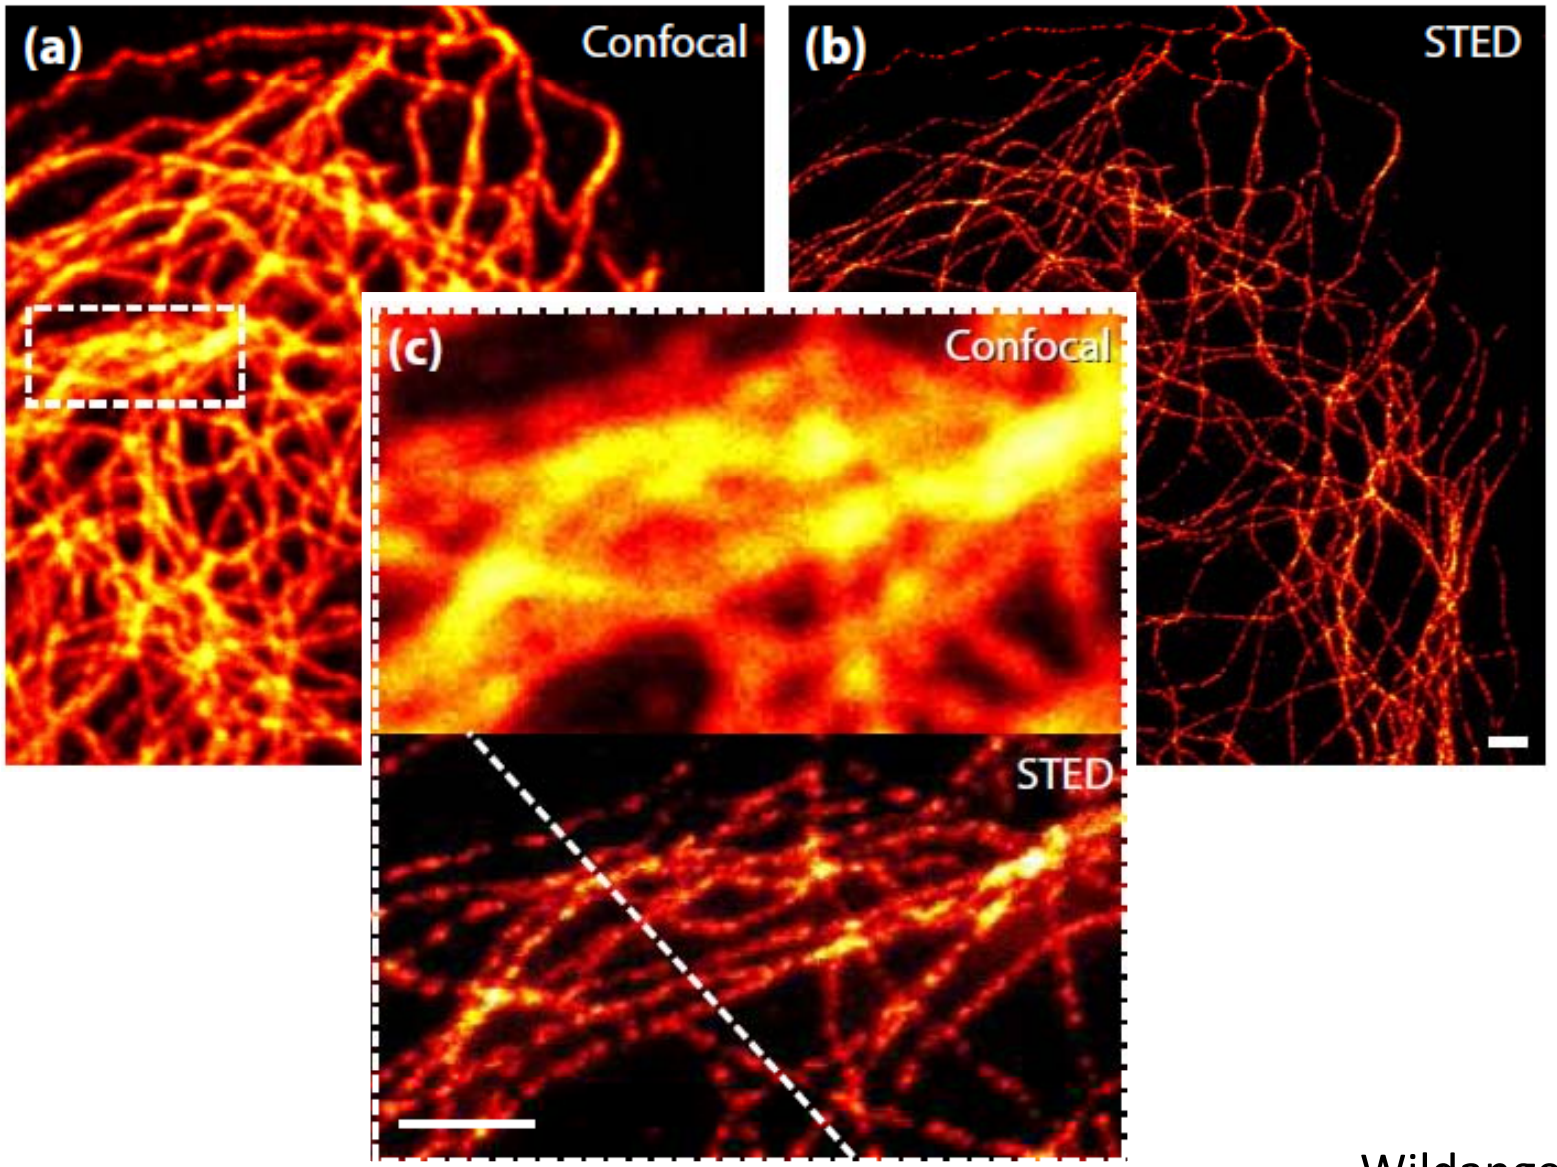


$$I_{\mathrm{STED}} = 100 I_S$$

$$d = \frac{1}{\sqrt{1 + I / I_s}} \cdot \frac{\lambda}{2NA}$$

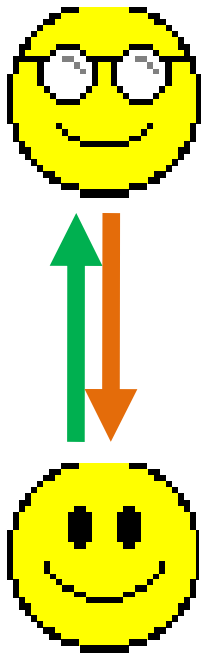


STED images of microtubules

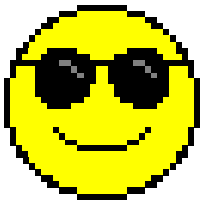


Wildanger et al., 2009

The “patterned illumination” approach



Multiple cycles



- Ground state
- Triplet state
- Isomerization

etc.

The limit of “Super-Resolution”

Unbound theoretical resolution

$$d = \frac{1}{\boldsymbol{S}} \cdot \frac{\lambda}{2NA}$$

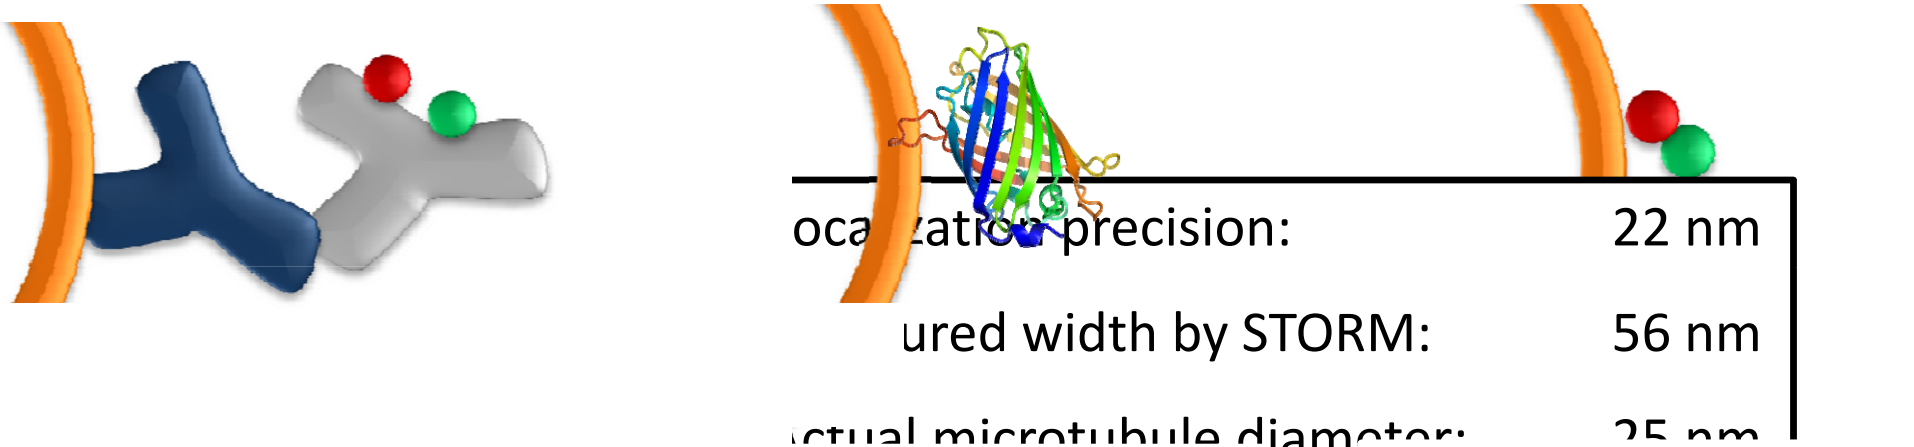
- STORM/PALM $S = \sqrt{N}$
  - 6,000 photons → 5 nm
  - 100,000 photos during Cy5 life time → < 1 nm
- STED $S = \sqrt{1 + I/I_s}$
  - 1:100 contrast of the donut → 20 nm
  - Diamond defects: 8 nm

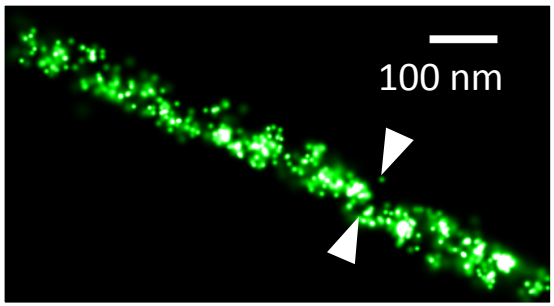
Effective resolution: Probe size matters

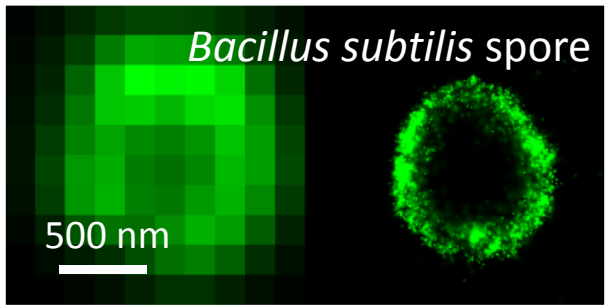
Antibodies:
~ 10 nm

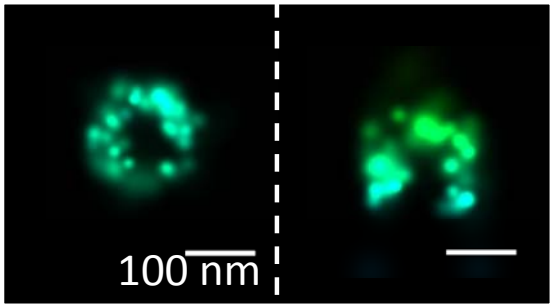
Fluorescent Proteins:
~ 3 nm

Small fluorophores:
~ 1 nm







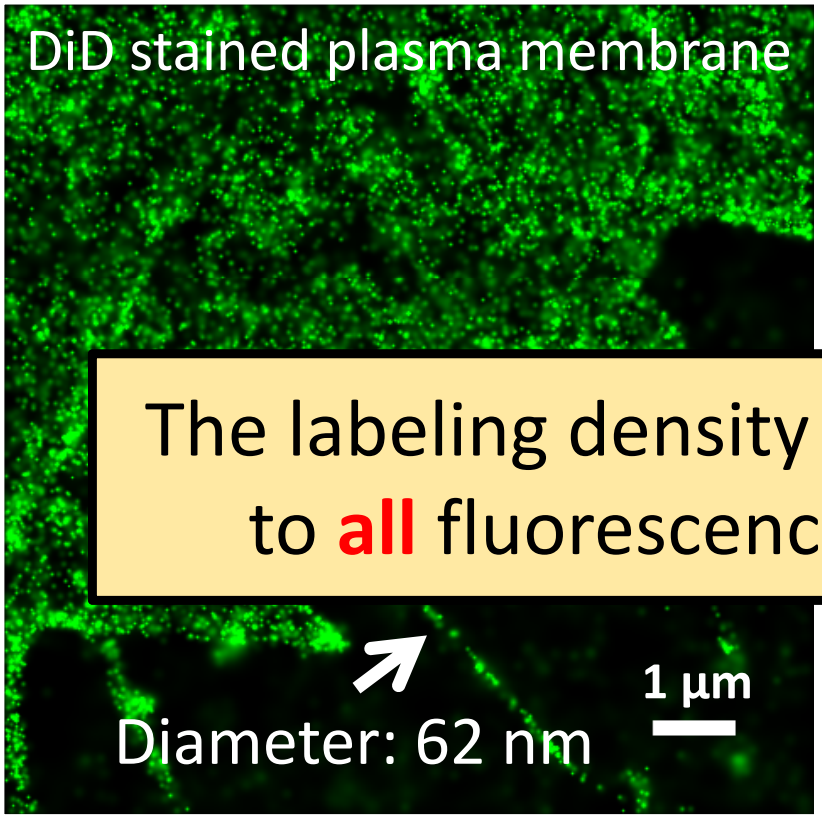


~ 6000 photons

< 1000 photons

~ 6000 photons

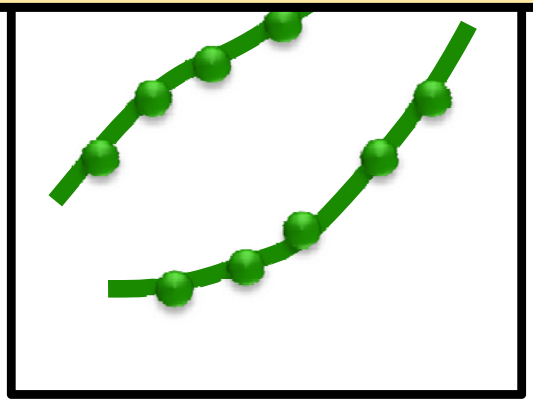
Effective resolution: Density matters



1000 frames, 10 sec total time

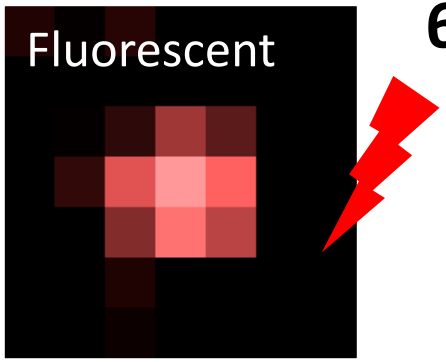
- Localization precision
  - 1000 photons -> 20 nm
- Localization density

The labeling density limit of resolution applies to **all** fluorescence microscopy methods



Point to point distance ≈ ½ Feature size

Effective resolution: contrast matters



650 nm

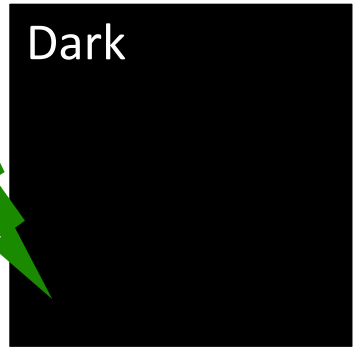
1%

photoactivation

Deactivation

360 nm

650 nm



99%

1% means…

Homogeneous sample Microtubule

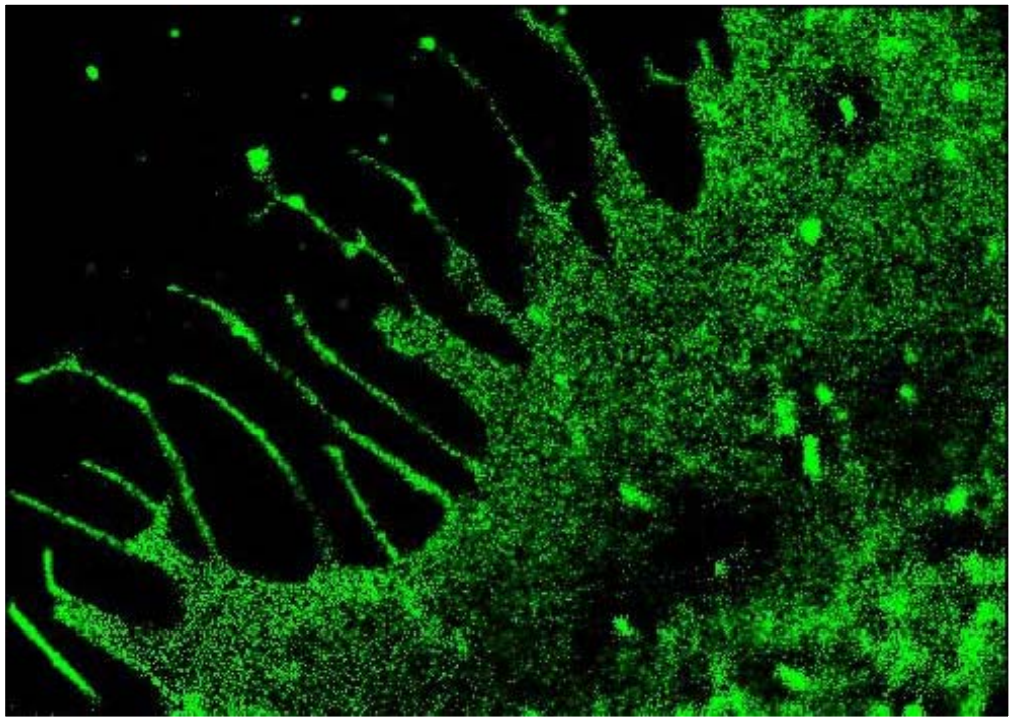
Common dye blinking: >3%

Cy5-MEA: 0.1-0.2%

mEos2: 0.001%

No such limit for non-single methods of SIM and STED

Time resolution: density matters



25 sec time resolution, 100x real time
3 mM mercaptoethylamine
1 µm

Typical Localization accumulation:
28 points / $\mu m^2 \cdot s$

Effective resolution:
70 nm at 25 sec integration time

Now as fast as 2 sec time resolution
with 1000 frames / sec camera

Comparison of time resolution

2D		Spatial resolution	Time resolution
SIM	Wide-field	120 nm	9 frames (0.09 sec)
STED	Scanning	60 nm	1 x 2 µm: 0.03 sec 10 x 20 µm: 3 sec
STORM/PALM	Wide-field	60 nm	3000 frames (3 sec)

3D		Spatial resolution	Time resolution
SIM	Wide-field	120 nm	15 frames x 10 (1.5 sec)
STED	Scanning	60 nm	1 x 2 x 0.6 µm: 0.6 sec 10 x 20 x 0.6 µm: 60 sec
STORM/PALM	Wide-field	60 nm	3000 frames (3 sec) – no scan!

With the creation of new tools…
